Research Interests

Imbue minimal yet meaningful knowledge into various layers of the I/O stack, thereby enabling a more efficient, synergistic, and adaptive storage ecosystem.

1. File and storage systems: how to interact and manage storage components efficiently.
2. Solid state drives: how to optimize the tradeoffs between capacity, performance, and reliability.
3. Green computing and sustainability: how to improve resource utilization and design sustainable storage architectures.

Experience and Internship

•**Syracuse University** *May 2020 – Now*
Research Assistant Syracuse, NY
- Advisor: Prof. Bryan S. Kim
- **All-flash array and sustainable systems**: optimizing system performance and storage sustainability by exploiting device heterogeneity from a larger SSD pool.
- **Failure-resilient storage systems**: exploiting the tradeoffs among capacity, performance, and reliability (CPR) in SSDs for performance stability and aging-resilience.
- **ML for storage and storage for ML**: (1) imbuing intelligence to the storage systems so that they can self-learn, self-configure, and self-manage. (2) designing a data loading system that optimizes cache partitioning and data sampling for the data processing pipeline.
- **Next-generation storage stack with emerging devices**: exploring the design of a storage stack using emerging devices (e.g., Flexible Data Placement) instead of traditional block devices.
